

A Pressing Concern? How Newspaper Coverage Affects Accountability in State Legislatures*

Revision 1.5

Andrew C. W. Myers[†]

February 23, 2024

Abstract

State legislatures are critical policymaking bodies, yet recent studies suggest that elections rarely hold state legislators accountable for their representation and voters generally know little about legislative politics. Would elections function and legislators behave differently if voters had access to more information about legislative politics? I construct and validate a measure of congruence between newspaper markets and legislative districts in all 99 state legislative chambers for the years 2000-2022 to evaluate how the quantity of legislative news coverage shapes elections and accountability. Leveraging these data, I demonstrate that newspaper coverage has an important monitoring effect on legislative elections and legislator behavior. Specifically, I find that the average electoral return to ideological moderation is at least 40% larger in districts with the most robust press coverage in comparison to districts with the weakest coverage. I also document that the incumbency advantage is at least two times as large when news coverage is strongest. Beyond elections, I show that press coverage incentivizes legislators to work more for their constituencies. When newspapers cover legislative politics closely, legislators miss fewer roll-call votes, sponsor more bills, and are more-active on committees. Finally, I find that legislators diverge less from their district's median voter when newspaper coverage is strong. These results underscore the importance of robust media coverage for legislative accountability and suggest that legislative elections and state legislators would be more moderate, representative, and productive were press coverage strengthened.

*For data the author thanks Andrew Hall, Jim Snyder, and Erik Peterson.

1 Introduction

State legislatures are critical policymaking bodies, yet recent studies suggest that elections rarely hold state legislators accountable for their lawmaking (Birkhead, 2015; Hogan, 2008; Rogers, 2017), and voters know little about legislative politics (Rogers, 2023; Songer, 1984; Squire and Moncrief, 2019). Since the electoral connection between voters and legislators underpins canonical theories of legislative behavior (Fenno, 1978; Mayhew, 1974), its breakdown has important implications for legislative representation and elections. The absence of robust legislative accountability mechanisms is commonly attributed to the low-information news environment in which state legislatures operate (e.g., Carey et al., 2006). Without active political news coverage, incumbents may work less for their constituencies (Arnold, 2004; Snyder and Stromberg, 2010) and face limited threat of being thrown out of office for unresponsive policy making (Ferejohn, 1986). Despite widespread concern about accountability and the decline of local news, there is limited evidence on how the state legislative media environment shapes legislator behavior and elections. Would elections function and legislators behave differently if voters had access to more information about legislative politics? Understanding how the legislative news environment shapes elections and legislator behavior is important in light of the secular decline of local news sources in general (Hayes and Lawless, 2015, 2018; Martin and McCrain, 2019; Peterson, 2021*b*) and legislative reporting resources in particular (Worden, Matsa, and Shearer, 2022).

While observers have long worried about elections and accountability in low-information media environments, empirical evidence on the effect of news coverage on legislative races is sparse because news coverage is endogenous to many political and economic outcomes. In this paper, I construct a measure of congruence between newspaper markets and state legislative districts that is plausibly exogenous to confounding political and economic variables (Peterson, 2021*a*; Snyder and Stromberg, 2010). Pairing this measure of news congruence with a modified regression discontinuity design and models of electoral selection, I am able to identify the causal effect of newspaper coverage on elections and representation. To guard

against concerns about omitted variable bias, throughout the analysis I show that my results are robust to the inclusion of a battery of legislative race, representative, and district controls.

I begin by investigating whether my measure of congruence predicts observed levels of legislative news coverage. To do so, I count the number of newspaper articles written about incumbent state legislators in 256 geographically-representative newspapers for the years 2000-2020. This dataset encompasses 75% of all state legislative districts for the period of study. Using these data, I find that the number of newspaper articles written about the incumbent state legislator is strongly increasing in district readership share. Since legislative news coverage is a function of readership share, my measure of congruence between newspaper markets and legislative districts also strongly predicts legislative news coverage. Specifically, a shift in congruence from zero to one is associated with between 93 and 99 more newspaper articles written about the average legislator.

Having validated my measure of newspaper coverage, I investigate how news congruence affects state legislative elections. First, I evaluate prominent claims that electoral returns to moderation are higher when races receive stronger news coverage (Canes-Wrone and Kistner, 2023; Hall, 2015; Rogers, 2017). Drawing on the midpoint design of Ansolabehere, Snyder, and Stewart (2001), I find that active newspaper coverage of state legislative elections has an important moderating effect on electoral selection. The electoral return to moderation in contested general elections is at least 40% larger in districts with the strongest newspaper coverage in comparison to those with the weakest coverage and as much as 60% larger. Second, I test the prediction that the incumbency advantage is larger when media coverage of elections is stronger (Ansolabehere and Snyder, 2002; Ashworth and Bueno De Mesquita, 2008). Leveraging the regression discontinuity design of Lee (2008), I find strong evidence that the combined personal and party incumbency advantage is at least two times as large in the most congruent legislative districts in comparison to the least congruent districts.

In the second half of the paper, I explore how news coverage shapes legislator behavior,

including performance and representation. I find robust evidence that the fourth estate incentivizes legislators to work harder for the constituency and converge to the median voter. Drawing on extensive roll-call, bill sponsorship, and committee assignment data, I demonstrate that legislators who receive more news coverage are more productive: they sponsor more bills, are absent from roll-call votes less often, and are more likely to serve on important legislative committees.

Finally, I test whether the well-documented ideological divergence between Democratic and Republican representatives' roll-call records (Ansolabehere, Snyder, and Stewart, 2001; Fowler and Hall, 2017, 2016; Lee, Moretti, and Butler, 2004) is reduced in highly congruent legislative districts. Following these previous studies, I use a regression discontinuity design to estimate how the quality of news coverage affects divergence in roll-call representation. I find that active newspaper coverage produces strong convergent forces in state legislative elections, forcing representatives to better moderate their ideological positions to their electorate (Downs, 1957; Hotelling, 1929; Black, 1958). Specifically, in close elections, the gap in representation between Democratic and Republican state legislators is approximately 20% smaller in districts with the highest level of newspaper congruence.

This paper builds most directly on work by Snyder and Stromberg (2010) on media coverage and political accountability in Congress. Snyder and Stromberg find that members of Congress better represent their constituencies when local news coverage is stronger. I extend these results on representation to state legislatures. My extension of congressional results to state legislatures is important for at least two reasons. First, because an identifying feature of state legislatures is precisely their low levels of transparency (Broockman et al., 2012; Kirkland and Harden, 2018), it is not clear whether results about congressional media coverage apply to state legislatures. State legislatures also differ from Congress in terms of electoral competition (Handan-Nader, Myers, and Hall, 2022; Rogers, 2015; Squire, 2000), professionalism (Squire, 2017), and policy domain (Jewell, 2014), all of which limit the comparison of results across levels of government. Second, replication of existing research—

particularly in novel settings—is an essential part of scientific research. That I identify effects of active news coverage in state legislatures that are similar to those in Congress should bolster our confidence in this literature’s overall conclusions.

My analysis also complements Auslen’s (2023) work on dyadic issue representation in state legislatures. Auslen finds that legislators in more-congruent districts are more-likely to cast roll-call votes that match their district’s preferences on abortion, same-sex marriage, gun control, medicaid expansion, and the minimum wage. Where Auslen studies dyadic issue representation, my paper focuses on ideological representation and elections. Complementing Auslen’s research on issue representation, I find that the ideological divergence between how Democratic and Republican legislators represent the same district is smaller when newspaper coverage of legislative elections is more robust. However, in contrast to Auslen I find that news coverage enhances the overall incumbency advantage in legislative elections and newspaper congruence has strong effects on voters’ political knowledge. While our designs are similar, my paper incorporates a broader set of circulation and newsprint data, potentially accounting for these differing results.¹

Further, my research follows in a vibrant literature on accountability in legislatures. One strand of this literature emphasizes how elections function as mechanisms that force self-interested officeholders to advance the interests of their constituents (Austen-Smith and Banks, 1989; Barro, 1973; Ferejohn, 1986), and that electoral competition forces legislators to adopt median-representative policies (Downs, 1957; Wright, Erikson, and McIver, 1994). In parallel with these expectations, extensive work on Congress (Ansolabehere, Snyder, and Stewart, 2001; Canes-Wrone, Brady, and Cogan, 2002; Carson et al., 2010; Hall, 2015) and state legislatures (Handan-Nader, Myers, and Hall, 2022) find that ideologically extreme candidates receive lower vote shares.

¹Where Auslen (2023) focuses on newspapers included in the Alliance for Audited Media’s (AAM; formerly the Audit Bureau of Circulation) reports for the years 2011-2022, my paper includes both AAM and non-AAM newspaper circulation for the years 2000 to 2022. Since non-AAM newspapers tend to be smaller (Snyder and Stromberg, 2010) and likely focus on local news, they are particularly important to include in an analysis of often highly-localized legislative elections.

A growing literature, however, suggests that the strength of these accountability mechanisms is conditional on active media coverage. In congressional elections, the penalty to nominating an extremist primary candidate may be as much as three times larger when congruence is high (Hall, 2015), and news congruence strengthens the tie between candidates' ideology and electoral outcomes (Canes-Wrone and Kistner, 2023). Evidence on how news coverage affects accountability in state legislative elections is largely missing, with one important exception. Rogers (2017) finds that voters in states with more state legislative newspaper reporters are better able to hold their representatives accountable for ideological divergence. While foundational, these results are based on a coarse measure of news coverage that is likely correlated with many other facets of legislative elections. Following Snyder and Stromberg (2010), my newspaper congruence design addresses these concerns while expanding the analysis across time and legislative chambers.

In this paper, I focus on media effects revealed through newspapers. Existing research shows that local television allots less time to congressional (Hess, 1991; Vinson, 2003) and state legislative (Kaplan, Goldstein, and Hale, 2003) activity than newspapers. Future work should consider whether local television also augments accountability in state legislative elections.

Finally, an important drawback of my analysis is that my data only cover the years 2000 to 2020. Over recent decades, increased choice in news options has shifted mass media consumption away from sources with traditionally high political coverage to outlets with more-limited political coverage that is often highly nationalized (Hindman, 2008; Hopkins, 2018; Prior, 2007; Stroud, 2011). Further, due to economic pressures, the overall quantity of local news has declined significantly (Hayes and Lawless, 2018, 2015; Martin and McCrain, 2019). However, recent research suggests that newspapers remain an important driver of political knowledge, although these effects may be as much as one-half to one-third the size of previous eras (Peterson, 2021*a*). Importantly, these trends should bias my analysis against finding meaningful effects of newspaper coverage on legislative elections and representation.

The remainder of the paper is organized as follows. Section two outlines my empirical strategy, including my measure of newspaper market–legislative district congruence and data sources. In Section three, I validate my measure of congruence. Section four evaluates how media coverage affects legislative elections, including returns to moderation and the incumbency advantage. In Section five, I show how congruence shapes legislative productivity and representation. Section six concludes.

2 Empirical Strategy

2.1 Measuring Newspaper-District Congruence

Despite widespread interest, there is limited evidence on the impact of news coverage on local elections because the quantity and quality of news media are endogenously determined by political and economic variables. To overcome this challenge, I adapt the newspaper congruence design of Snyder and Stromberg (2010) to state legislative elections. This design leverages the fact that a newspaper’s coverage of a legislator is partially a function of its share of readers residing in that legislator’s district (Hayes and Lawless, 2015; Snyder and Stromberg, 2010; Vinson, 2003). Intuitively, if the majority of a newspaper’s readers reside in a single district, the newspaper will cover that district’s legislator much more closely than legislators in other nearby areas. Conversely, a newspaper that straddles multiple districts will split its coverage of legislators accordingly, resulting in less-active political newspaper coverage. Identification in this design relies on the assumption that the economic factors that shape newspaper markets are often orthogonal to political boundaries.² The result is natural variation in newspaper coverage that is plausibly orthogonal to economic and political confounding variables.

Following previous work, I formalize this relationship by calculating the overlap (i.e., “congruence”) between newspaper markets and state legislative districts. Specifically, let

²See Snyder and Stromberg (2010) for a full validation of this assumption.

x_{md} be the number of newspapers sold by newspaper m in district d in year t .³ Then m 's market share in d is given by

$$MarketShare_{md} = \frac{x_{md}}{\sum_{m'} x_{m'd}} \quad (1)$$

and m 's share of readers in district d is given by

$$ReaderShare_{md} = \frac{x_{md}}{\sum_{d'} x_{md'}}. \quad (2)$$

Intuitively, *MarketShare* represents each newspaper's share of total sales in a given district, while *ReaderShare* captures the share of a newspaper's readership that resides in the district. To capture congruence, I weight *ReaderShare* by *MarketShare* to account for the probability that coverage reaches a given reader:

$$Congruence_d = \sum_{m=1}^M MarketShare_{md} ReaderShare_{md}. \quad (3)$$

In equation 3, *Congruence_d* ranges from zero to one. When congruence is equal to one, there is perfect overlap between newspaper markets and legislative districts, suggesting that the newspaper will concentrate its coverage on that district's legislator. Congruence near zero indicates that voters will often be exposed to newspaper coverage about an incumbent that is not their legislator.

I calculate *Congruence_d* for every district in all 99 state legislative chambers for the years 2000-2020, accounting for both decennial and court-initiated redistricting. County level newspaper circulation data (i.e., x_{mc}) are from Peterson (2021a). These data were digitized from the 2008, 2014, and 2018 editions of the Standard Rate and Data Service

³Here and henceforth the index t is implicit. I observe paper-county circulation data, x_{mc} . Following Snyder and Stromberg (2010), I assume that the number of copies of newspaper m sold in county c is proportionate across district d . Hence, I impute district-level circulation as $x_{md} = \sum_c (\frac{n_{cd}}{\sum_{d'} n_{cd'}} x_{mc})$, where n_{cd} is the population of the part of district d in county c .

Circulation handbook.⁴ Population statistics (i.e., n_{cd}) were imputed from Census Bureau redistricting files at the block level.

2.2 Data on Legislative Performance and Representation

To implement my study, I build datasets on legislative performance and representation from a variety of sources. First, to measure legislator productivity, I assemble data on state legislative roll-call voting and bill sponsorship from Fournaies and Hall (2022) and the online data vendor Legiscan.com. These data include roll-call votes and bill introductions for the near-universe of chamber-years for the years 2010-2022 and roughly half of chamber-years for the years 2000-2009. Approximately 20% of the data originate from Fournaies and Hall (2022) and the remaining 80% were collected by the author from Legiscan.com.⁵ To this dataset I merge in data on state legislative committee assignments and chamber leadership positions for the years 2000-2014 from Fournaies and Hall (2018).

Lastly, I build an extensive battery of controls legislative race, representative, and district controls, matching Snyder and Stromberg (2010) at the state legislative-level. These data cover this paper’s full period of study and were collected from IPUMS and the Census Bureau.

All datasets were matched to a master dataset of state legislative election returns and candidate ideology scalings from Handan-Nader, Myers, and Hall (2022) and Myers (2023).

⁴Following Peterson (2021a) and Snyder and Stromberg (2010), I interpolate circulation for missing years.

⁵While every effort was made to assemble a complete panel, data for a number of state-chambers was unavailable for early years of the analysis. Exact details on the sample are provided in Appendix Section A.1.

3 Congruence Predicts Legislative Newspaper Coverage and Voter Political Knowledge

The foundation of this paper is the assumption that the number of articles a newspaper publishes about a legislator is increasing in that newspaper’s share of readers who live in the related legislative district. This section introduces a novel legislative news coverage dataset and tests this assumption. After showing congruence predicts newspaper coverage, I evaluate whether this coverage boosts voters’ knowledge about state legislatures.

3.1 Newspaper Coverage

To measure legislator newspaper exposure, I use Newspapers.com to search 286 local and regional newspapers for papers about every incumbent state legislator in every election year between 1998 and 2020.⁶ These 286 newspapers cover 75% of all state legislative districts and contain 1.3 million papers about state legislators. Using these data, I construct the variable q_{mdt} which records the number of newspaper articles written by newspaper m about the incumbent in district d in year t . See Appendix Section A.2 for a complete description of this dataset.

As an initial test, I plot the relationship between the number of papers in newspaper m that are written about the legislator in district d in election cycle t (q_{mdt}) and m ’s readership share in d and t ($ReaderShare_{mdt}$). The results are shown in Figure 1 where $ReaderShare_{mdt}$ is logged for ease of presentation and the red dots represent averages of equally-sized bins. I find a strong positive relationship between $ReaderShare_{mdt}$ and q_{mdt} . That is, the number of papers written about the incumbent state legislator increases strongly in newspaper reader share.

Now, I formally test this motivating assumption while controlling for a variety of variables that likely affect legislator news coverage. This battery of controls includes all controls

⁶Data from Newspapers.com have been used extensively in previous empirical research (Gentzkow, Glaeser, and Goldin, 2006; Ban et al., 2019; Schuster, 2023).

Figure 1 – Newspaper Reader Share Shapes Legislator Press Coverages. The number of articles written by newspaper m about the legislator representing district d (vertical axis) is strongly increasing in newspaper m 's reader share in district d (horizontal axis). Triangles are averages of equal-sample-sized bins of the horizontal axis. The horizontal axis is logged, representing constant proportional change in reader share, and the solid line plots a third-degree polynomial which is fit to the underlying data.

employed in Snyder and Stromberg (2010), with the exception of an indicator for political scandal.⁷ These controls fall into three categories. First, I add legislator-specific controls, including indicators for whether the legislator is a freshman, a member of their chamber's majority party, and a chair of a legislative committee. I also control for the legislator's experience as measured by their tenure in the legislature. Second, I control for race characteristics, including whether the race was close (within 10%), was for an open seat, or was uncontested. Finally, I add district controls, including population density, median income,

⁷I add additional district and race controls to the original Snyder and Stromberg (2010) specification in order to match the specifications employed in subsequent sections. In Appendix Table B.5, I replicate the Snyder and Stromberg (2010) specification (with the exception of the scandal indicator), the results of which are nearly identical to those presented in the main text.

percent urban, percent retired, percent veterans, and percent foreign born. The summary statistics for these controls, along with their sources, are shown in Appendix Table A.3.

The results from this analysis are reported in Table 1. In columns one and two the unit of analysis is the district-newspaper-year and the outcome is q_{mdt} , the number of papers written by newspaper m about the legislator representing district d in year t . The key independent variable is *ReaderShare*. Following Snyder and Stromberg (2010), I include year fixed effects. Column one demonstrates that the relationship plotted in Figure 1 is highly statistically significant. In column two, the addition of legislator, race, and district controls does not meaningfully change these results.⁸ I find that change in newspaper reader share from zero to one is associated with between 94 and 90 more papers written about the incumbent state legislator.

Many of the control variables in column two enter with the expected effect. Longer-serving legislators, legislators in the majority, legislators running in close races, and legislators who chair committees receive, on average, more news coverage. Uncontested races receive less news coverage as do, surprisingly, open seat races, although this relationship is quite noisy.

Overall, the strong relationship between newspaper *ReaderShare* and newspaper coverage drives the results for the remainder of this paper. To emphasize this point, I calculate the sales-weighted number of papers written about the legislator representing district d in year t as

$$q_{dt} = \sum_{m=1}^M MarketShare_{mdt} \cdot q_{mdt}.$$

Columns three and four of Table 1 regress q_{dt} against district congruence, *Congruence_d*. Again I find a strong positive relationship between congruence and press coverage. An increase in congruence from zero to one is associated with an 86 or 88 paper increase in newspaper coverage. These estimates are roughly half the size of previous estimates for

⁸I have also confirmed that the results hold using any subset of the three sets of control variables.

Table 1 – Newspaper Reader Share and Legislator Press Coverages. After controlling for legislator, race, and district variables, newspaper *ReaderShare* strongly predicts observed press coverage. As a result, the *Congruence* between newspaper markets and districts is also highly predictive of legislative newspaper coverage.

		Count of Articles About Legislator (q_{mdt})		Sales-Weighted Articles About Legislator (q_{dt})	
		(1)	(2)	(3)	(4)
ReaderShare		94.37 (8.17)	99.14 (7.30)		
Congruence				93.05 (4.89)	94.89 (4.90)
Legislator Controls	Freshman		-1.96 (1.03)		-0.81 (0.21)
	Experience		0.39 (0.11)		0.11 (0.01)
	In Majority		0.22 (0.95)		-0.16 (0.19)
	Chair		5.72 (2.40)		1.27 (0.55)
Race Controls	Close Race		1.33 (1.06)		0.56 (0.20)
	Uncontested Race		-1.90 (0.74)		-0.44 (0.18)
	Open Seat		-0.79 (0.92)		-0.05 (0.22)
	Population Density		-0.94 (0.89)		-0.59 (0.19)
District Controls	Median Income		-0.00 (0.00)		-0.00 (0.00)
	% Urban		0.10 (0.04)		0.10 (0.04)
	% Retired		-0.21 (0.31)		-0.21 (0.31)
	% Veterans		-0.01 (0.34)		-0.01 (0.34)
	% Foreign Born		0.37 (0.21)		0.37 (0.21)
N		85,338	85,205	46,384	46,294
Unit of Observation		Dist.-Paper-Year	Dist.-Paper-Year	District-Year	District-Year
Controls		No	Yes	No	Yes
Fixed Effects		Year	Year	Year	Year
Standard Error Clusters		Newspaper	Newspaper	District	District

Note: The sales-weighted average number of articles about a legislator in district d in time t is $q_{dt} = \sum_{m=1}^M \text{MarketShare}_{mdt} \cdot q_{mdt}$. The definition of q_{cdt} is analogous. Results are stronger after logging *ReaderShare* and *Congruence*.

Congress (Snyder and Stromberg, 2010).⁹

In sum, I find that newspaper *ReaderShare* is highly predictive of legislative news coverage. As a result, newspaper coverage of state legislators is stronger when *Congruence*—or the degree of overlap between newspaper markets and legislative districts—is higher.

3.2 Voter Political Knowledge

Having shown that *Congruence* predicts newspaper coverage of state legislators, I now investigate whether this coverage translates into increased voter knowledge about legislative politics. To do so, I use data from the 2018 Congressional Election Study (CES) which asked respondents to name their lower chamber state representative. I mapped each respondent to their lower chamber state legislative district, creating an indicator for whether they correctly identified the name of their state legislator.¹⁰

The results are reported in Table 2. Column one of Table 2 reports the baseline effect without controls, while column two adds controls for respondent characteristics. Controls include respondent level of education (6 categories), race (8 categories), party ID (7 categories), family income (16 levels), interest in politics (five categories), age, number of years the respondent has lived in their current city. I find that a shift from the lowest to highest newspaper congruence in my sample is predicted to increase respondents’ probability of correctly identifying their state legislator by 16 or 18 percentage points.¹¹ Considering that only 22% of respondents in my sample could identify their state legislator, the effect of newspaper congruence is substantial.

In this section, I have provided evidence that my measure of congruence between state legislative districts and newspaper markets strongly predicts actual newspaper coverage of

⁹Note, however, that Snyder and Stromberg (2010) analyze newspaper references for the years 1991-2002, while I examine the period 2000-2020.

¹⁰The CES reports respondents’ locations at the ZIP code level, which often map to more than one state legislative district. Following Rogers (2023), I take a conservative approach and code a response as correct if the respondent identifies any of the lower-chamber state legislators representing their ZIP code area.

¹¹The CES data includes both voters and non-voters. My conclusions are unchanged after restricting the data to respondents who voted in the 2018 midterm elections.

Table 2 – Newspaper Congruence and Legislative Name Recognition. *Congruence* strongly predicts voters’ probability of correctly identifying their lower chamber state legislator.

	State Legislator Name Recognition	
	(1)	(2)
Congruence	0.16 (0.07)	0.18 (0.08)
N	853	821
Respondent Controls	No	Yes
State FEs	Yes	Yes

Note: Standard errors are clustered by district in parentheses. Controls include respondent level of education (6 categories), race (8 categories), party ID (7 categories), family income (16 levels), interest in politics (five categories), age, number of years the respondent has lived in their current city.

legislative politics. Further, using CES data, I find that this increased newspaper coverage translates into stronger voter knowledge about legislative politics. Having validated the assumptions of this study, I now consider the effects of *Congruence* on legislative elections and legislator behavior.

4 Press Coverage and Legislative Elections

In this section, I use my data on district *Congruence* to evaluate two prominent claims about how news coverage affects elections. First, a key concern about the decay of local news media is that voters are less able to sanction candidates for ideological extremity. Previous work on congressional elections suggests that the electoral penalty for ideological extremism is indeed higher when news coverage is stronger (Hall, 2015; Canes-Wrone and Kistner, 2023), but there is little evidence for state legislative elections. In the first subsection, I test whether the electoral returns to moderation in state legislatures are higher when elections receive more news coverage. In the second subsection, I evaluate the prediction that the incumbency advantage will be greater for more visible races (Ansolabehere and Snyder,

2002; Ashworth and Bueno De Mesquita, 2008).

4.1 Electoral Returns to Moderation

Downsian logic suggests that candidates will perform better the closer they locate to the median voter (Downs, 1957; Hotelling, 1929; Black, 1958). In line with this expectation, extensive work finds that voters prefer more-moderate candidates to more-extreme candidates (Ansolabehere, Snyder, and Stewart, 2001; Burden, 2004; Canes-Wrone, Brady, and Cogan, 2002; Erikson et al., 2000; Tomz and Van Houweling, 2008; Handan-Nader, Myers, and Hall, 2022). It is plausible, though, that voters will be less able to respond to candidates' ideology when news coverage of legislative elections is low. In this subsection, I test whether the well-documented electoral returns to moderation in state legislative elections (Handan-Nader, Myers, and Hall, 2022) require active media coverage.

To assess how news coverage affects electoral returns to moderation, I compare the ideology of competing Democratic and Republican candidates and predict their electoral returns to changes in ideological platform. I rely on the estimated ideological positions of state legislative candidates from Handan-Nader, Myers, and Hall (2022) (henceforth "HMH Scores") which leverage supervised machine learning to predict incumbents roll call ideology (i.e., NP-Scores).¹² Following Ansolabehere, Snyder, and Stewart (2001), I estimate an equation of the form

$$Y_{dct} = \beta_0 + \beta_1 Midpoint_{dct} + \beta_2 Distance_{dct} + \beta_3 Congruence_{dct} + \beta_4 Midpoint_{dct} \cdot Congruence_{dct} + \Omega X_{dct} + \alpha_d + \delta_t + \epsilon_{dct}. \quad (4)$$

where Y_{dct} is either the Democratic candidate's general election vote share or a victory

¹²I prefer HMH Scores because these scalings correlate highly within-party to NP-Scores ($r = .78$ for Democrats and $r = .72$ for Republicans) and are trained using only *before* a candidate first wins office. As Hall and Snyder (2015) note, restricting the scaling matrix to donations before a candidate takes office avoids potentially biasing the scalings if a subset of donors strategically contribute to candidates (e.g., access-seeking interest groups).

indicator in district d in chamber c in year t .¹³ *Midpoint* and *Distance* are the midpoint and distance between Democratic and Republican candidates, respectively, and *Congruence* is my measure of newspaper market-legislative district congruence. X_{dct} is an optional vector of controls and the error term, ϵ_{dct} , is clustered by district d . Finally, to hold the districts' median voter constant, I control for the Republican presidential candidate's vote share in the most recent presidential election.¹⁴

Previous research on state legislatures suggests that β_1 is positive and between .12 and .3, indicating that candidates benefit from ideological moderation (Handan-Nader, Myers, and Hall, 2022).¹⁵ The term β_4 tests whether this advantage is stronger in districts with more-congruent newspaper coverage.

Table 3 reports my estimates of the midpoint model (i.e., Equation 4). Across all specifications, I find robust evidence that newspaper congruence strengthens the relationship between ideological moderation and electoral success. In column one, without any additional controls, I find that a shift from congruence of zero to one increases the expected electoral returns to moderation by 42% (.11/.26). After adding controls for candidate contributions (column 2) and district, race, and representative controls (column 3), I again find that news congruence enhances electoral returns to moderation. Column two (three) suggests that a shift in congruence from zero to one would increase the midpoint coefficient by 47% (64%). In Appendix C, I show that the assumptions of the multiplicative interaction model appear to hold using the R package *Interflex* and that similar results hold for the Democratic candidate's win probability. In short, I find that congruence moderates the relationship between ideology and vote share, and this effect has real implications for which candidate wins the election.

¹³Since this design requires competition between one Democratic and one Republican candidate, I restrict my sample to elections in contested single-member districts when using the midpoint model.

¹⁴This decision matches Ansolabehere, Snyder, and Stewart (2001). Note that, since congruence is generally constant within district-regimes, I cannot employ district fixed effects to hold the median voter constant.

¹⁵Focusing on the lower bound of .12, this estimate suggests that one standard deviation increase in the midpoint would increase the Democratic vote share by 1.56 percentage points.

Table 3 – Effect of News Congruence on Advantage of Moderate Candidates in Contested General Elections. Moderate candidates receive higher vote-share and win-probability returns in districts with more-congruent newspaper coverage.

	Dem Vote Share		
	(1)	(2)	(3)
Midpoint	0.26 (0.02)	0.19 (0.01)	0.11 (0.01)
Midpoint · Congruence	0.11 (0.05)	0.09 (0.04)	0.07 (0.04)
Rep. Pres. Vote Share	-0.74 (0.01)	-0.59 (0.01)	-0.52 (0.01)
Dem Contributions		0.02 (0.00)	0.01 (0.00)
Rep Contributions		-0.02 (0.00)	-0.01 (0.00)
N	7,335	6,864	6,864
District Controls	No	No	Yes
Race Controls	No	No	Yes
Controls	No	No	Yes

Note: The outcome is either Democratic vote share or a Democratic win indicator. Robust standard errors are clustered by district in parentheses. Midpoint and Distance variables are scaled to run from 0 to 1. The sample is limited to contested general elections in single member districts and, hence, *Race Controls* excludes the dummy for contested races. Models include state-by-chamber and year fixed effects.

4.2 The Incumbency Advantage

The incumbency advantage has received extensive scholarly attention in the context of congressional and state legislative elections. In addition to highlighting the extraordinary advantage incumbents receive in their reelection bids, previous research suggests that the incumbency advantage is larger for higher-visibility offices and races.¹⁶ I test this prediction, using my measure of *Congruence* as a proxy for race visibility.

¹⁶Specifically, Ashworth and Bueno De Mesquita (2008) propose that, if news environments are equally informative across elections, the incumbency advantage is increasing in the informativeness of the news signals. This comparative static arises because, as voters receive better information, they become more confident about their selected candidate. Hence, future information is less likely to change their mind, helping the incumbent. Ansolabehere and Snyder (2002) find support for this hypothesis across levels of government, but previous research has not examined this prediction across state legislative races.

To evaluate this prediction, I employ the regression discontinuity design of Lee (2008).¹⁷ This design compares party vote shares in time $t + 1$ in districts where the margin of victory (and, hence, incumbency status) was close in time t . Since vote share is continuous around $50\% + 1$ but incumbency status changes discontinuously, this difference estimates the change in vote share that is attributable to being the incumbent. However, since I am interested in how *Congruence* affects the incumbency advantage, I modify the original Lee (2008) design to allow for heterogeneity in the incumbency advantage following recent. Specifically, for district d in election t , I estimate OLS regressions of the form:

$$\begin{aligned}
\text{Dem Vote Share}_{dt+1} = & \alpha_0 + \alpha_1 V_{dt} + \alpha_2 T_{dt} + \alpha_3 C_{dt} + \\
& \beta_1 V_{dt} C_{dt} + \beta_2 V_{dt} T_{dt} + \beta_3 C_{dt} T_{dt} + \\
& \gamma_1 V_{dt} C_{dt} T_{dt} + \\
& [\alpha_4 \mathbf{W}_{dt} + \beta_4 V_{dt} \mathbf{W}_{dt} + \beta_5 T_{dt} \mathbf{W}_{dt} + \gamma_2 T_{dt} V_{dt} \mathbf{W}_{dt} +] \\
& \delta_t + \varepsilon_{dt}.
\end{aligned} \tag{5}$$

The term $\text{Dem Vote Share}_{dt+1}$ is the Democrat’s vote share in time $t + 1$, T_{dt} is an indicator for the Democrat’s victory in time t , V_{dt} is the Democratic candidate’s general election win margin in time t , C_{dt} is the district’s *Congruence*, δ_t represents a year fixed effect, and \mathbf{W}_{dt} is an optional vector of control variables. This specification matches recent empirical and theoretical work on so-called “heterogeneity-in-discontinuities” designs (Bansak and Nowacki, 2022; Olson, 2020; Desai and Frey, 2023).

Table 4 reports the results from this exercise. Throughout Table 4, I combine a local linear estimator estimated separately on each side of the discontinuity with the optimal bandwidth from Calonico, Cattaneo, and Titiunik (2014) (e.g., Desai and Frey, 2023). For each specification, I report estimates at the optimal bandwidth and bandwidths that are 25% larger and smaller than the optimal bandwidth. Hence, the bandwidth used in each column

¹⁷As Fowler and Hall (2014) note, this design captures the weighted average of the personal and party incumbency advantages.

Table 4 – Regression Discontinuity Estimates of the Incumbency Advantage in High and Low-Congruence Districts. The incumbency advantage is higher in more-congruent districts. Note that this effect includes both personal and party incumbency advantages.

	Baseline			Interactive Model			Interactive Model With Controls		
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Dem Win · Congruence				0.05 (0.03)	0.06 (0.02)	0.05 (0.02)	0.07 (0.03)	0.09 (0.03)	0.06 (0.02)
Dem Win	0.05 (0.00)	0.05 (0.00)	0.05 (0.00)	0.04 (0.00)	0.04 (0.00)	0.05 (0.00)	0.00 (0.05)	-0.01 (0.04)	0.00 (0.04)
Congruence				-0.08 (0.02)	-0.09 (0.02)	-0.09 (0.01)	-0.03 (0.02)	-0.06 (0.02)	-0.05 (0.02)
N	6,432	8,523	10,530	6,047	8,012	9,943	5,143	6,795	8,455
Optimal Bandwidth	.068	.068	.068	.064	.064	.064	.068	.068	.068
Bandwidth Factor	.75	1	1.25	.75	1	1.25	.75	1	1.25
Estimate Bandwidth	.051	.068	.085	.048	.064	.08	.051	.068	.086
Year FEs	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Controls	No	No	No	No	No	No	Yes	Yes	Yes

Note: In all columns the outcome is the Democrat’s vote share in time $t + 1$. Controls include race, representative, and district controls. Standard errors are clustered by district in parentheses. *Estimate Bandwidth* is the bandwidth used in each column and is the product of the *Optimal Bandwidth* and the *Bandwidth Factor*.

(*Estimate Bandwidth*) is the product of the *Optimal Bandwidth* (from Calonico, Cattaneo, and Titiunik, 2014) and the *Bandwidth Factor*. First, as a baseline, columns one through three estimate the incumbency advantage in state legislative elections without reference to *Congruence*. I find that incumbency in time t causes a 5 percentage point increase in party vote share in the subsequent election. This estimate is slightly smaller than Lee’s (2008) estimate of 7.7 percentage points in U.S. House elections.

Next, in columns four through six of Table 4, I allow the treatment effect to vary according to levels of *Congruence*. The coefficient on the interaction term indicates that incumbents running in districts with perfect congruence with newspaper markets receive a vote-share bonus that is typically double that of incumbents in theoretical districts with zero congruence. Finally, in columns seven through nine of Table 4 I introduce district, race, and representative controls and allow their relationship with vote share to vary across the discontinuity. This strategy provides more-compelling identification of a causal effect of the

moderator *Congruence* on vote share. After this inclusion, my results are highly similar and statistically significant.

Hence, Table 4 confirms previous theoretical predictions: the incumbency advantage is significantly stronger when news coverage of legislators is better.

5 Legislative Behavior and Representation

The results from the previous section suggest that the presence of active newspaper coverage alter the functioning of legislative elections. When press coverage is strong, the electoral returns to moderation and incumbency advantage are higher. In this section, I explore how news coverage influences legislator behavior, including legislative productivity and representation.

5.1 Legislative Productivity

Robust media coverage of politics allows voters to monitor the behavior of their representatives (Arnold, 2004; Snyder and Stromberg, 2010). In the absence of robust media coverage, however, legislators may have weak incentives to engage in costly forms of legislative productivity. This may happen, for example, if legislators serving low-information districts suspect that their shirking of legislative responsibilities will go unnoticed, or that their expenditure of effort will be overlooked by their electorate. While previous work suggests that the removal of electoral incentives leads to lower state legislative productivity (Fourniaies and Hall, 2022), there is no evidence on how press coverage affects state legislative productivity. In this section, I evaluate how news coverage affects legislative productivity.

Voting, working on committees, and writing bills constitute many of the most important activities for legislators. By casting roll-call votes, legislators engage in a highly-consequential form of position-taking (Mayhew, 1974), while missing a roll-call vote may

reflect non-ideological shirking (Bender and Lott, 1996).¹⁸ Strategic committee membership and service allows legislators to prioritize and expedite the demands of their constituency (e.g., Shepsle, 1989, 1978; Gilligan and Krehbiel, 1987; Weingast and Marshall, 1988, although also see Berry and Fowler 2016). Finally, crafting and sponsoring legislation may aid legislators in building a personal legislative agenda (Schiller, 1995). Hence, following previous work on state legislative productivity, my analysis focuses on these three indicators of productivity (Fouirnaies and Hall, 2022).

I operationalize these three forms of legislative productivity using the roll-call, bill sponsorship, and committee activity data described in Section 2.2. First, to capture how often legislators participate in floor votes, I calculate the percent of all floor roll-call votes in which a legislator cast a vote either in favor or against to the motion.¹⁹ Second, to measure legislative bill-writing and sponsorship activity, I calculate the number of bills that each legislator sponsored in a given legislative session. Third, I measure committee service using the committee activity index created by (Fouirnaies and Hall, 2022). This index measures a legislator’s aggregate committee responsibility across all committee assignments. Finally, following Fouirnaies and Hall (2022) and Dal Bó and Rossi (2011), I create a summary measure of legislative productivity by extracting the underlying latent dimension of the three productivity measures using principle components analysis. Appendix Table A.3 reports the summary statistics for these measures.

Table 5 regresses the four measures of productivity on press congruence. Throughout the analysis I include state-by-chamber-by-session fixed effects to account for differential levels of productivity across chambers and time. As a result, Table 5 makes within state-chamber-session comparisons.²⁰ In even columns I also include the district, race, and representative controls from Section 2.2. Further, to account for potential non-linearities in the effect of

¹⁸Further, roll-call voting is one of the legislative activities that is most-commonly covered by newspapers (Arnold, 2004).

¹⁹While I observe both floor votes and votes within committees, I focus on the former to avoid conditioning on committee membership.

²⁰Appendix Table D.7 shows that my results are highly similar after accounting for differential party effects.

Table 5 – Active Newspaper Coverage Increases Legislative Productivity. Active newspaper coverage is associated with fewer missed roll-call votes, more bill sponsorships, and more-active committee membership.

	Percent of Floor Votes		Sponsored Bills		Committee Activity		Aggregate Productivity Index	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Congruence	2.001 (0.307)	0.444 (0.336)	3.087 (0.848)	1.691 (0.809)	0.578 (0.153)	0.259 (0.149)	0.307 (0.115)	0.191 (0.102)
N	34,535	34,383	34,535	34,383	4,987	4,898	9,029	9,029
District Controls	No	Yes	No	Yes	No	Yes	No	Yes
Race Controls	No	Yes	No	Yes	No	Yes	No	Yes
Representative Controls	No	Yes	No	Yes	No	Yes	No	Yes
State x Chamber x Year FEs	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Note: Outcomes are reported in column headers. Standard errors are clustered by state-chamber in parentheses.

population density and urbanness, I add five dummies for log population density and percent urban intervals.

The first two columns of Table 5 show the estimated effect of a shift in press congruence from zero to one on the percent of roll-call votes a legislator casts. Legislators representing districts with robust newspaper coverage miss between .5 (column two) and 2 (column one) percentage points fewer roll-call votes than legislators representing districts with poor press coverage.²¹ Focusing on column one, since the average state legislator casts a vote in 94.6% of all roll-calls, the effect of active press coverage represents an 37% increase in the missed-vote rate. This estimate is similar in absolute value to the effect of being a lame-luck term-limited legislator (Fouirnaies and Hall, 2022) or the extension of a legislator’s term length (Titiunik, 2016).

Next I consider bill sponsorship. Columns three and four of Table 5 show the effect of press congruence on the number of bills a legislator sponsors. I find that robust press coverage is, on average, associated with between 1.7 and 3 more bills sponsored by a legislator. This change represents a 18% to 33% proportional increase in bill sponsorship. In columns five

²¹Since the missed vote rate may be correlated with travel time to the capital, in Appendix Table D.8 I add a control for the distance between each districts’ centroid and the state capital. My results remain unchanged.

and six, I estimate the effect of press congruence on committee activity. While the estimates for committee activity are relatively precise, the effect is substantively small: the theoretical effect of a change in congruence from zero to one is associated with between a 5% and 9% increase in committee productivity. Finally, columns seven and eight aggregate my three measures of productivity into a single scale. The results mirror my findings for the individual components.

Collectively, the results in Table 5 suggest that press coverage plays an important role in driving legislator effort and productivity. Legislators that receive stronger news coverage are absent for fewer roll-call votes, sponsor more legislation, and are more active on committees.

Having considered productivity, I now transition to studying legislative representation.

5.2 Representation Divergence

Political polarization has reached historic levels across American legislative landscapes, generating widespread concern about diminished legislative productivity, efficiency, and responsiveness (Mann and Ornstein, 2012; McCarty, Poole, and Rosenthal, 2006; Shor and McCarty, 2011; Krugman, 2004). A defining feature of this polarization is the divergence in representation between Democratic and Republican legislators. Despite Downs' prominent prediction that candidates will converge to the median voter (Downs, 1957; Hotelling, 1929; Black, 1958), previous work documents systematic and persistent divergence in American legislatures (Fowler and Hall, 2016, 2017; Lee, Moretti, and Butler, 2004). Scholars have advanced numerous explanations for the failure of convergence, including voter preferences for non-ideological characteristics (Ashworth and Bueno de Mesquita, 2009; Bernhardt and Ingberman, 1985; Eyster and Kittsteiner, 2007; Groseclose, 2001), the threat of a third-party entrant (Palfrey, 1984), and uncertainty over electoral outcomes (Calvert, 1985; McCarty et al., 2019; Wittman, 1983).

Surprisingly, there is little evidence on how news coverage shapes legislative representation divergence. One important exception is Snyder and Stromberg (2010) who show that

congressional divergence is smaller in districts with stronger newspaper coverage. We might expect, for example, legislative media coverage to decrease representation divergence by prompting legislators to place more weight on their constituents' preferences. Alternatively, the legislative media environment may be too weak to meaningfully alter representatives' behavior. The following section addresses this question.

To assess the effect of press coverage on divergence, I use a regression discontinuity design to compare representation in districts where the Democratic candidate barely won to districts where the Republican candidate barely lost (Fowler and Hall, 2016, 2017; Lee, Moretti, and Butler, 2004) across values of *Congruence_d*. In the neighborhood of the discontinuity, this design isolates the effect of an election result (Imbens and Lemieux, 2008) and its assumptions have been shown to hold in the context of state legislative elections (Eggers et al., 2015).

As a fundamental element of representation, I use legislators' roll-call votes to capture representation in state legislatures as measured by Shor and McCarty's (2011) NP-Scores. For this design, I focus on contested state legislative elections in single-member districts. Specifically, for district d in election t I estimate OLS regressions of the form:

$$\begin{aligned}
NP_{Score}_{dt} = & \alpha_0 + \alpha_1 V_{dt} + \alpha_2 T_{dt} + \alpha_3 C_{dt} + \\
& \beta_1 V_{dt} C_{dt} + \beta_2 V_{dt} T_{dt} + \beta_3 C_{dt} T_{dt} + \\
& \gamma_1 V_{dt} C_{dt} T_{dt} + \\
& [\alpha_4 \mathbf{W}_{dt} + \beta_4 V_{dt} \mathbf{W}_{dt} + \beta_5 T_{dt} \mathbf{W}_{dt} + \gamma_2 T_{dt} V_{dt} \mathbf{W}_{dt} +] \\
& \delta_t + \varepsilon_{dt}.
\end{aligned} \tag{6}$$

In district d in election t , NP_{Score}_{dt} is the winning candidate's NP-Score, T_{dt} is an indicator for a Democratic candidate victory, V_{dt} is the Democratic candidate's general election win margin, C_{dt} is the district's *Congruence*, δ_t represents a year fixed effect, and \mathbf{W}_{dt} is an optional vector of control variables. Note that this design mirrors the specification employed in Equation 5.

Table 6 – RD Estimates of Divergence in High and Low-Congruence Districts. Districts with high newspaper congruence have less divergence in roll-call representation between narrowly elected Democratic and Republican legislators.

	Baseline			Interactive Model			Interactive Model With Controls		
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Dem Win · Congruence				0.28 (0.12)	0.27 (0.10)	0.30 (0.10)	0.30 (0.12)	0.28 (0.11)	0.24 (0.10)
Dem Win	-1.39 (0.02)	-1.41 (0.02)	-1.42 (0.02)	-1.42 (0.03)	-1.42 (0.02)	-1.45 (0.02)	-1.37 (0.23)	-1.53 (0.20)	-1.07 (1.41)
Congruence				0.36 (0.08)	0.32 (0.07)	0.31 (0.07)	0.01 (0.09)	0.06 (0.08)	0.08 (0.07)
N	8,015	10,730	13,454	7,601	10,203	12,758	8,757	11,759	14,788
Optimal Bandwidth	.066	.066	.066	.063	.063	.063	.085	.085	.085
Bandwidth Factor	.75	1	1.25	.75	1	1.25	.75	1	1.25
Estimate Bandwidth	.05	.066	.083	.047	.063	.078	.064	.085	.106
Year FEs	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Controls	No	No	No	No	No	No	Yes	Yes	Yes

Note: In all columns the outcome is legislators’ NP-Score. Controls include race, representative, and district controls. Standard errors are clustered by district in parentheses. *Estimate Bandwidth* is the bandwidth used in each column and is the product of the *Optimal Bandwidth* and the *Bandwidth Factor*

The coefficient α_2 is the effect of narrowly electing a Democratic legislator on the associated district’s roll-call representation. Previous work uncovers significant divergence in close state legislative elections (Fowler and Hall, 2017, 2016), implying that α_2 is negative. For this study, I am interested in β_3 , or the marginal effect of narrowly electing a Democrat on roll-call representation when *Congruence_d* shifts from zero to one. In other words, β_3 estimates the difference in roll-call divergence that is attributable to active newspaper coverage.

The results are reported in Table 6. As in Table 4 above, throughout Table 6 I estimate optimal bandwidths (*Optimal Bandwidth*) using the algorithm in Calonico, Cattaneo, and Titiunik (2014). To emphasize that my results are robust across bandwidths, I report estimates at the optimal bandwidth and bandwidths that are 25% larger and smaller than the optimal bandwidth (the *Bandwidth Factor*). Columns one through three of Table 6 show the estimates from a reference RDD that replicates existing research—that is, it omits all terms

containing $Congruence_d$.²² The negative coefficients on $Dem\ Win$ in columns one through three indicate that the coin-flip election of a Democratic state legislator shifts the associated district’s roll-call representation in the liberal direction.

The remainder of Table 6 shows estimates from Equation 7. In columns four through six I estimate a baseline interactive RDD. The positive coefficient on the interaction term $Dem\ Win \cdot Congruence$ indicates that divergence in representation is smaller in more-congruent legislative districts. Specifically, I find that a shift from negligible to perfect press congruence reduces divergence by roughly 20%.

The baseline RDD specification suggests that a meaningful difference in divergence exists across values of $Congruence$. In columns seven through nine, I add controls to evaluate whether $Congruence$ causes a difference in the RDD effect (Bansak and Nowacki, 2022). The results from this exercise are similar in magnitude in the baseline specification and suggest that $Congruence$ can reduce divergence. Finally, observe that the estimates reported in Table 6 are stable across different bandwidths and control specifications.

In sum, I find strong evidence that robust press coverage reduces representation divergence in state legislative elections. The coin-flip election of a Democratic legislator causes a approximately 20% decrease in representation divergence in comparison to a counterfactual Republican legislator representing the same district.

6 Discussion

Robust political media coverage is widely regarded a key ingredient of democratic governance. Press coverage is often, however, uneven and lacking across political arenas. This concern is particularly acute in light of the secular decline of state legislative news coverage. By one count, the number of full-time newspaper reporters covering state legislatures has declined by

²²Specifically, I estimate equations of the form

$$NP\text{Score}_{dt} = \alpha_0 + \alpha_1 V_{dt} + \alpha_2 T_{dt} + \beta_2 V_{dt} T_{dt} + \delta_t + \varepsilon_{dt}. \quad (7)$$

34% since 2014, further depleting the already low-information legislative news environment.²³ Does the lack of legislative news coverage alter the functioning of legislative elections or legislators' behavior?

This is an important question, and future work should continue to investigate how accountability functions in low-information environments. However, the results reported in this paper suggest that press coverage has an important monitoring effect on legislative elections and legislator behavior. When press coverage of legislative elections is stronger, I find that the electoral returns to ideological moderation and the incumbency advantage are higher. Hence, newspapers appear to enable voters to sanction candidates for ideological extremity.

Press coverage also shapes legislator behavior. I find that legislators who receive stronger newspaper coverage miss fewer roll-call votes, sponsor more bills, and are more-active on legislative committees. In short, press coverage incentivizes legislators to work more for their constituencies. Finally, I show that press coverage causes legislators to converge in the direction of the median voter.

Overall, my findings underscore the importance of press coverage for electoral accountability, particularly in low-information environments.

A Data Coverage and Descriptive Statistics

A.1 Roll Call and Bill Sponsorship Data

State legislative roll-call and bill sponsorship data were collected by the author from the online data vendor Legiscan.com and combined with similar data from Fourniaies and Hall (2022). These data include roll-call votes and bill introductions for the near-universe of chamber-years for the years 2010-2022 and roughly half of chamber-years for the years 2000-2009. Approximately 20% of the data originate from Fourniaies and Hall (2022) and the remaining 80% were collected by the author from Legiscan.com. Table A.1 reports the full coverage of the roll-call dataset.

Table A.1 – Roll Call Data Coverage Matrix. This table reports the coverage of my roll-call dataset in terms of states and years. Cells contain the number of roll-call votes observed in thousands.

A.2 Incumbent Newspaper Coverage

To build a comprehensive dataset of observed legislative news coverage, I identify 286 local and regional newspapers on Newspapers.com. Taken together, these newspapers cover legislative politics in 75% of all state legislative districts, including every state except Alaska. For every newspaper I search for references to state legislators representing districts within that newspaper’s circulation area. Due to the extensive nature of this data collection task, I restrict this search to each districts’ legislative election year. These results are then aggregated at the newspaper-district-year level to create q_{mdt} . Table A.2 shows the coverage of this dataset by year.

Table A.2 – Number of Newspapers and papers in Sample. This table reports the number of newspapers and total newspaper articles included in my sample. Coverage is sparse in odd years because only five states have off-cycle state legislative elections.

Year	N. papers	N. Newspapers	Year	N. papers	N. Newspapers
1998	118953	151	2010	106060	193
1999	21259	18	2011	9068	19
2000	132314	147	2012	80004	190
2001	1923	3	2013	2607	8
2002	143681	168	2014	87133	186
2003	15796	19	2015	7097	17
2004	167209	205	2016	70663	183
2005	928	3	2017	2339	7
2006	157903	207	2018	53078	187
2007	13576	19	2019	3548	16
2008	139479	208	2020	40231	183
2009	1450	6	-	-	-

A.3 Descriptive Statistics

Table A.3 – Summary Statistics for Key Variables

Variable	Mean	Median	Min	Max	Std. Dev.	Source
Close Race	0.3	0	0	1	0.46	SLERs
Uncontested Race	0.38	0	0	1	0.48	SLERs
Open Seat	0.18	0	0	1	0.39	SLERs
Freshman	0.22	0	0	1	0.41	SLERs
Experience	6.9	4	0	60	7.5	SLERs
In Majority	0.63	1	0	1	0.48	Author
Chair	0.38	0	0	1	0.49	Fourinaies (2018)
Population Density	6.4	6.4	-0.12	12	2	IPUMS
Median Income	56212	53855	22020	130890	14046	IPUMS
% Urban	74	81	0	100	24	IPUMS
% Retired	15	15	4.9	46	3.4	IPUMS
% Veterans	4.5	3.4	0.2	26	2.6	IPUMS
% Foreign Born	9.2	6.7	0.18	53	8.3	Census Bureau

Table A.4 – Summary Statistics for Key Variables

Variable	Mean	Median	Min	Max	Std. Dev.
Percent of Floor Votes	0.95	0.98	0	1	0.089
Sponsored Bills	8.8	2	0	614	20
Committee Activity	3.5	3	0	11	1.9
Aggregate Productivity Index	0.13	-0.44	-1.3	29	1.2

B Newspaper Market–Legislative District Congruence Robustness Checks

Table B.5 – Newspaper Reader Share and Legislator Press Coverages. After controlling for legislator, race, and district variables, newspaper *ReaderShare* strongly predicts observed press coverage. As a result, the *Congruence* between newspaper markets and districts is also highly predictive of legislative newspaper coverage.

	Count of Articles About Legislator (q_{mdt})		Sales-Weighted Articles About Legislator (q_{dt})	
	(1)	(2)	(3)	(4)
ReaderShare	94.37 (8.17)	93.88 (8.29)		
Congruence			93.05 (4.89)	102.23 (7.49)
Leader		12.33 (2.46)		2.03 (0.43)
Sought Higher Office		4.38 (1.58)		0.90 (0.39)
Out of State		-26.31 (2.68)		-4.13 (0.21)
Close Race		3.31 (0.85)		1.09 (0.25)
Freshman		-6.38 (1.28)		-1.79 (0.18)
% Retired		-0.05 (0.38)		-0.42 (0.05)
% Urban		0.27 (0.05)		0.08 (0.01)
Median Income		-0.00 (0.00)		-0.00 (0.00)
N	85,338	55,002	46,384	29,683
Unit of Observation	Dist.-Paper-Year	Dist.-Paper-Year	District-Year	District-Year
Controls	No	Yes	No	Yes
Fixed Effects	Year	Year	Year	Year
Standard Error Clusters	Newspaper	Newspaper	District	District

Note: Results are stronger after logging *ReaderShare* and *Congruence*.

C Electoral Selection Robustness Checks

Table C.6 – Effect of News Congruence on Advantage of Moderate Candidates in Contested General Elections. Moderate candidates receive higher win-probability in districts with more-congruent newspaper coverage.

	Dem Win		
	(1)	(2)	(3)
Midpoint	1.28 (0.10)	0.94 (0.10)	0.50 (0.09)
Midpoint · Congruence	0.64 (0.26)	0.53 (0.23)	0.56 (0.22)
Rep. Pres. Vote Share	-2.78 (0.06)	-2.11 (0.06)	-1.89 (0.06)
Dem Contributions		0.09 (0.00)	0.06 (0.00)
Rep Contributions		-0.08 (0.00)	-0.05 (0.00)
N	7,335	6,864	6,864
District Controls	No	No	Yes
Race Controls	No	No	Yes
Representative Controls	No	No	Yes

Note: The outcome is either Democratic vote share or a Democratic win indicator. Robust standard errors are clustered by district in parentheses. Midpoint and Distance variables are scaled to run from 0 to 1. The sample is limited to contested general elections in single member districts. Models include state-by-chamber and year fixed effects.

Figure C.1 – Marginal Effects Plot for General Election Electoral Selection. This figure plots the marginal effect of congruence on Democratic vote share. Model specifications match Table 3 column 1.

D Productivity Robustness Checks

In Table D.7, I account for differential productivity trends between parties of the same chamber potentially arising from majority party agenda and committee control. To do so, I substitute state-by-chamber-by-year fixed effects for state-by-chamber-by-party-by-year fixed effects. My substantive results remain unchanged.

Table D.7 – Active Newspaper Coverage Increases Legislative Productivity. Active newspaper coverage is associated with fewer missed roll-call votes, more bill sponsorships, and more-active committee membership.

	Percent of Floor Votes		Sponsored Bills		Committee Activity		Aggregate Productivity Index	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Congruence	1.524 (0.287)	0.483 (0.336)	0.527 (0.606)	0.850 (0.724)	0.341 (0.140)	0.241 (0.169)	0.042 (0.087)	0.120 (0.089)
N	34,520	34,368	34,520	34,368	4,987	4,898	9,027	9,027
District Controls	No	Yes	No	Yes	No	Yes	No	Yes
Race Controls	No	Yes	No	Yes	No	Yes	No	Yes
Representative Controls	No	Yes	No	Yes	No	Yes	No	Yes
State x Chamber x Party x Year FEs	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Note: Outcomes are reported in column headers. Standard errors are clustered by state-chamber in parentheses.

Second, since the missed vote rate may be correlated with travel time to the capital, I Table D.8 I add a control for the distance between each district's centroid and the state capital. My results are again unchanged.

Table D.8 – Active Newspaper Coverage Increases Legislative Productivity. Active newspaper coverage is associated with fewer missed roll-call votes, more bill sponsorships, and more-active committee membership.

	Percent of Floor Votes		Sponsored Bills		Committee Activity		Aggregate Productivity Index	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Congruence	1.524 (0.287)	0.483 (0.336)	0.527 (0.606)	0.850 (0.724)	0.341 (0.140)	0.241 (0.169)	0.042 (0.087)	0.120 (0.089)
N	34,520	34,368	34,520	34,368	4,987	4,898	9,027	9,027
District Controls	No	Yes	No	Yes	No	Yes	No	Yes
Race Controls	No	Yes	No	Yes	No	Yes	No	Yes
Representative Controls	No	Yes	No	Yes	No	Yes	No	Yes
State x Chamber x Party x Year FEs	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Note: Outcomes are reported in column headers. Standard errors are clustered by state-chamber in parentheses.
